

The title clips – and the result is wrong.

Three problems are stacked on one card. **(1) The title is truncated with an ellipsis** – "EVERY 4:00 MIN X 4 ROUN..." – which the poster engine **never** does; named titles **wrap**. **(2) That string isn't a name** – it's the EMOM cadence, force-fed into `wod.title` and repeated three times. **(3) The result is a weight**. This is **interval training, not "for time"** – and 37.5kg is the load you *chose*, not an outcome. An interval is scored by whether you **held the work**, never by a clock or a 1RM. Below: what shipped, and the same WOD mapped correctly – title, format, and result.

BEFORE what shipped

AFTER engine · Chalk · interval EMOM

THE FIELD MAPPING – WHAT TO SEND THE ENGINE

FIELD	SHIPPED (WRONG)	CORRECT
type	'METCON'	'EMOM' – it's every-interval work, not a metcon
title	'EVERY 4:00 MIN X 4 ROUNDS' – the cadence shoved into the name slot	"(empty)" – no name, so the engine promotes <code>format</code> to the headline
format	'emom'	'EVERY 4:00 × 4' – one tight cadence token, fits on a line
block.label	'EVERY 4 MIN · 4 ROUNDS' – third copy of the same string	drop it (or keep only here) – say the structure once
result	37.5kg framed as the hero – the chosen load, not an outcome	<code>{ kind:'rounds', value:'4 / 4' }</code> held – or <code>{ kind:'pace', value:'2:41' }</code> Load stays a movement tag.

THE RESULT · AN INTERVAL ISN'T SCORED BY TIME OR WEIGHT

A The hero is completion – not a clock, not a weight

37.5kg is the load you *chose* to do the reps at; it already lives correctly as the quiet tag next to "8 Thruster." Promoting it to the hero with a "result" label reads like a 1RM. The honest flex of an EMOM is **holding the prescribed work every window** – so the hero becomes **4 / 4 rounds held**, with the load demoted to a fact in the label (`@ 37.5kg`). Toggle the AFTER card to compare.

B If you log per-round times, pace is the stronger flex

The real interval differentiator is **how much rest you bought yourself** – your work time inside each window. When the app captures it, make the hero **fastest / avg round** (`2:41`) and carry rounds-held as the supporting line. Never "up from" / for-time framing.

→ The result model needs a kind

Right now `result` is an untyped `{ label, value }`, so the app guessed "weight." Give it `result: { kind, value, label }` where `kind ∈ 'time' | 'reps' | 'load' | 'rounds' | 'pace'`. An **interval WOD is logged as 'rounds' or 'pace'** and is **never asked for a finish time or a max weight**. The logger picks the score type from the WOD format, not the other way around.

THE TITLE → WHAT TO DO

1 Never truncate the title – wrap it

The card was forced to one line with `white-space:nowrap; overflow:hidden; text-overflow:ellipsis`, eating "...DS" off ROUNDS. A poster's whole job is to be shared and read – losing letters is the worst outcome. The engine renders named titles with `white-space:normal; text-wrap:balance` and **no ellipsis ever**. Remove the clamp and let it wrap to two lines.

2 This isn't a name – it's the cadence

"EVERY 4:00 MIN X 4 ROUNDS" describes the EMOM structure, not a workout name. The brand hierarchy is fixed: **the result is the hero, the name is a small label**. When there's no real name, leave `wod.title` empty – the engine then promotes `wod.format` to the headline at the right size. Put a tight token there: `'EVERY 4:00 × 4'`.

3 Stop saying the structure three times

It appeared as the title, the subtitle line, *and* the block label. Project rule: **don't repeat the name in title AND subtitle**. Pick one home for the cadence (the format line is ideal) and let the movement block just list the movements.

4 When a real name exists, it wraps – never shrink-to-clip

If someone actually names a WOD (CHELSEA, MURPH, FRAN), it goes in `wod.title`, wraps to ≤2 lines via `text-wrap:balance`, and the cadence sits below it as the smaller label. The hero result and the layout below are untouched.

Hardening: auto-fit long unnam / formats

Press / Blueprint / Hazard / Ink / Bout / Foil already ramp `titleSize` down by string length so a long headline always fits. **Slab / Chalk / Flare / Stadium use a fixed size + nowrap** — under the card's `overflow:hidden` a long unnamed `format` would silently clip instead of ellipsis.

Port the same `titleSize` ramp to those four skins so the cadence shrinks to fit rather than getting cut.
